AT&T Control Center
puts operations in your hands,
so you can be hands-off.

Set-and-forget your IoT processes and manage them with ease.

The sheer number of IoT devices and processes existing in a single enterprise can become daunting, especially as each performs a specific function with their own subtleties. New automation rules and tools available within AT&T Control Center eases the task of managing your devices by letting the platform do the heavy lifting.

By automating your processes, you'll cut down on the time you spend with your IoT device administrative work. And we know that time is the most important resource of all. AT&T Control Center's suite of rules & tools can help you better manage data costs, monitor your devices for specific behaviors, and increase their performance.

The rules and tools offers within AT&T Control Center:

- **Session Start/Stop –** Monitor a device when it opens a communication session

- **Automation Rules –** Execute an automated action when a notification or alert is received

- **Customer Hosted Radius –** Receive important information from the RADIUS server

- **URL Filtering –** Increase protection from malware sites

- **Location-Based Services –** Track your IoT devices within 1,000 meters

We'd like to spend less time with you.

That may seem like an unusual thing to say, but when the management of your devices is automated, it means you're spending less time on the phone with customer support. You're getting that time back to focus on growing your business, saving on operations costs, and experiencing less headaches. That's the true power of AT&T Control Center.

AT&T network

The AT&T network supports integrated systems with a single, highly secure network with nationwide service and redundancies. Take advantage of our progressive and ever-improving network to drive innovation for your business.
